Domain Algorithms / desktop

Stack Python 3 + Tkinter (stdlib) + heapq

Status Working - ~90% complete

Live / Deploy Not publicly deployed

Overview

The Python implementation of the Dijkstra visualizer - the cleanest of the three, using a proper generator-based algorithm.

Key Features & Technical Highlights

- Generator-based Dijkstra with lazy heap deletion (heapq).
- File-backed login; animated steps.

Engineering Evidence & Metrics

- ~1,294 LOC; the most idiomatic implementation.

Why It Matters (application / interview talking points)

- Demonstrates clean algorithmic Python and good use of the standard library.
