Proud

Repo / Path	asadbek/Imposter (+ signed builds in asadbek/mobile)
Domain	Mobile game (offline party / social deduction)
Stack	Kotlin 2.0.21, Jetpack Compose + Material 3, Hilt, Navigation-Compose, DataStore, kotlinx-serialization, MVVM/StateFlow, AGP 8.7.3, JDK 17
Status	Production-ready - ~90-95% complete; signed release artifacts built
Live / Deploy	Signed AAB/APK built (play + full flavors)

Overview

A native Kotlin port of the Imposter pass-and-play party game (3-12 players on one device): a complete flow of setup -> deal roles -> clues -> discussion -> vote -> eliminate -> final guess -> results. Built to professional Android standards and ready for Play Store submission.

Key Features & Technical Highlights

- Complete game state machine implemented as a pure, testable engine.
- Clean Compose + Hilt + MVVM/StateFlow architecture with Navigation-Compose.
- 9 word packs (~50 word pairs each) localised in English, Russian and Uzbek.
- play / full product flavors; real signing config with a release keystore.
- DataStore persistence, age-gate and ads handling, privacy policy and localised store listings.

Engineering Evidence & Metrics

- 38 Kotlin files, ~4,720 LOC.
- 4 unit-test files, 788 LOC of tests on the game engine.
- Real signing chain (release-keystore.jks) + multi-flavor Gradle build.
- PRIVACY.md + localised store listings; signed release AAB/APK already produced.

Why It Matters (application / interview talking points)

- The single most production-real piece in the portfolio - the only project with a full signing chain, tests, store assets and shippable artifacts.
- Shows you can take a product from engine design to a store-ready, tested, localised mobile app end to end.

Honest Caveats

- Uses AdMob test IDs; no instrumented (UI) tests yet; no store screenshots committed.
