Overview

A first-person psychological-horror survival game (Granny-style): escape a sealed house while evading 'Agnes', an AI enemy, through a multi-step objective chain with three branching endings.

Key Features & Technical Highlights

- Rapier physics with a kinematic character controller.
- Full enemy AI: a state machine + Dijkstra navigation over the house graph.
- Procedural fallbacks for every asset; a sanity system; a no-soft-lock objective lock-graph.

Engineering Evidence & Metrics

- 24 files, ~3,412 LOC; the most complete game in the set.

Why It Matters (application / interview talking points)

- Combines real physics, pathfinding AI and narrative design - a rich, masters-worthy systems project.
