

Sarbon Frontend

Production B2B logistics / freight-management SaaS platform

★ MASTERS STANDOUT	Production	Portfolio	Masters	Proud
-----------------------	------------	-----------	---------	-------

Repo / Path	sarbon-frontend-main
Domain	Logistics / freight marketplace (B2B SaaS)
Stack	React 19, TypeScript 5.9 (strict), Vite 7, Ant Design 6, TanStack Query 5, Zustand 5, Axios, i18next (10 langs), WebRTC, SSE, Yandex Maps
Status	Live production product - ~90% complete
Live / Deploy	sarbon.me / api.sarbon.me

Overview

A serious multilingual logistics platform connecting cargo owners, dispatchers, driver-managers and drivers. Supports multi-step cargo creation (split / negotiable / request payments), a cargo marketplace with filters, favourites and XLSX export, an offer accept/reject lifecycle, trip management with ratings, role-protected live GPS tracking, real-time chat with media / voice / presence, WebRTC audio calls, and a full admin console (moderation, companies, analytics funnels, push diagnostics, geo, users).

Key Features & Technical Highlights

- Centralised typed API layer with a single Axios client and a real refresh-token queue (concurrent 401s coalesced into one refresh).
- Real-time layer built on fetch-based SSE streaming; WebRTC audio calls with signaling relayed over SSE/chat.
- Role-sensitive live GPS tracking with privacy gating, rendered on Yandex Maps.
- 10-language i18n (locale files 120-190KB each - genuinely translated, not stubs).
- Clean separation of server state (TanStack Query) and client state (Zustand + immer + devtools).
- Lazy + Suspense routing nested under `/:lang?` with error boundaries.

Engineering Evidence & Metrics

- 446 TypeScript/TSX files, ~78,000 LOC.
- 36 test files / 358 Vitest + RTL tests covering payload builders, permissions, formatters, GPS/chat helpers and stores.
- Two GitHub Actions workflows (prod + staging) that build and deploy dist/* to the server.
- Husky pre-commit running lint-staged + type-check; ESLint --max-warnings 0; Knip dead-code checks.
- Full OpenAPI spec set (base/root ~130KB each + ~30 path files) backing a live api.sarbon.me.
- 203 git commits, PR-based workflow; 47KB developer guide + flow docs for calls/chat/maps.

Why It Matters (application / interview talking points)

- Strongest evidence of real-world, team-scale engineering capability in the portfolio.
- Demonstrates mastery of hard frontend problems: token-refresh concurrency, real-time transport, WebRTC, i18n at scale.

Honest Caveats

- Reads as team / commercial work (org-tagged itgenius24, PR workflow) - in applications, state your specific contribution clearly.
- 2 known-failing unit tests (pre-existing payment-payload bug); README still says 5 languages while code ships 10.
