Domain	3D game / procedural generation
Stack	Three.js, TypeScript, Vite, custom capsule controller, custom GLSL grade, Playwright
Status	Working / production - ~88% complete
Live / Deploy	Not publicly deployed

Overview

A first-person liminal-horror game: a sealed, infinite procedural maze with a sanity system driving fog, grain, hum and entity aggression, descending levels and found-footage post-FX.

Key Features & Technical Highlights

- Watertight chunked maze generation that is provably sealed (no escape gaps).
- Sanity system coupling gameplay to post-processing intensity.
- Hand-tuned capsule character controller (no physics library); custom GLSL grade.

Engineering Evidence & Metrics

- 24 files, ~3,430 LOC (the largest Three.js app); full SPEC.md with 12 quality gates.
- 18-file QA harness with measured metrics (70 draw calls, flat memory, 0 console errors over 200 seeds x 3 levels).

Why It Matters (application / interview talking points)

- The most rigorous project in the WebGL set - procedural generation + measured QA is excellent engineering evidence.
